

## ABSTRACT OF THE DISCLOSURE

To facilitate high level transmission processing such as remote control of other devices by using wireless network such as short-distance wireless communication method or cable-based network capable of transmitting data bi-directionally, a command and its response of a specified type are transmitted through a channel set up in the network between one device and the other device connected to a specified wireless communication network. Then, a side receiving a command through the channel executes an action specified by that command.
